PulseIQ Phase 2 Report

Name: Poonam Satish Patole
Track: Data Analysts
Phase: Phase 2
Prepared: 28 October 2026
GitHub repository: PoonamPatole/pulseiq
Git tag: Phase-2

Task status and evidence

Task	Status	Evidence
6. Attendance and leave	Done locally	Dashboard screenshot; Attendance observations
7. Attrition analytics	Done locally	Dashboard screenshot; Three recorded findings
8. Team productivity	Done locally	Dashboard screenshot; Two-team manual verification
9. Payroll cost and reconciliation	Done locally	Dashboard screenshot; Five-month reconciliation
10. Budget and KPI targets	Done locally	Dashboard screenshot; Three manual variance checks

Proof it works

- **Task 6:** The lowest observed all-department attendance rates were May 2026 92.64%, January 2026 93.11%, and June 2026 93.16%. These observations do not establish a cause.
- **Task 7:** The dashboard aggregation returned Engineering (Mar 2025): 5 exits, 3.40%; Operations & IT (Mar 2024): 4 exits, 13.79%; Engineering (Apr 2025): 3 exits, 2.10%. Predicted risk is separate and small groups are suppressed.
- **Task 8:** Direct checks of `warehouse.fact_task`, sprint SP-01, matched velocity: Analytics & BI had 22 completed tasks / 79 points; Data Platform had 29 / 72.
- **Task 9:** Task 3 check DQ-C01 reports five payroll-to-ledger differences. June 2026 is -INR 18,450 (payroll minus ledger); the other four months are recorded for investigation. No payroll rows were excluded. The answer key is company-level and does not prove department allocation.
- **Task 10:** Three April 2025 hand checks matched dashboard actual-minus-budget variance: Engineering -INR 1,911,891.25 (-8.19%); Product & Design -INR 461,307.33 (-8.73%); Data & AI -INR 100,184.00 (-1.32%). Negative means underspend.

These are local data checks and manual reconciliations. No automated Streamlit app test report is recorded for Tasks 6-10.

What I learned

Attendance and leave measures can have different grains, so leave needs a company-wide caveat. Actual exits and modelled attrition risk answer different questions and should stay separate. Team velocity is easier to interpret with completed-task checks and sprint context. Payroll and budget comparisons need clear sign conventions, traceable sources, and visible uncertainty.

Problems and how I handled them

The attendance feed does not support reliable long-weekend labels, so I treat holidays as context, not cause. Attrition predictions are grouped and suppress groups below five. Payroll contains duplicate employee/run groups, orphan IDs, and five mismatches; I preserved the rows and documented differences rather than guessing what to remove. The answer key is company-level, so it cannot validate department allocation. I checked three budget rows by hand and made the variance direction explicit.

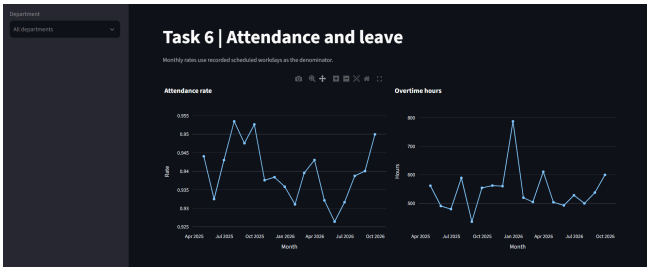

Plan for the next phase

Prepare a shareable deployment and check access from another device, then complete release materials and a demo. Keep payroll exceptions visible until Finance confirms corrections, and update evidence after an approved resolution. Commit the phase files, apply the Phase-2 tag, and record the release reference.

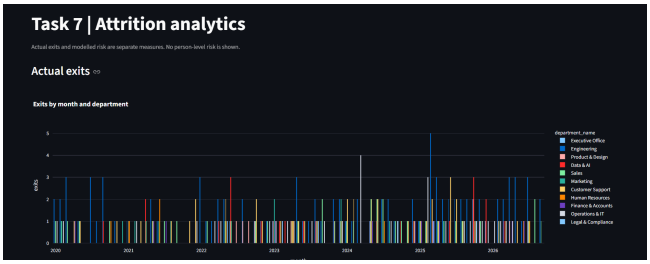

Dashboard screenshots

Selected screenshots from Tasks 6-10 are embedded below.

Task 6 - Attendance and leave

Task 7 - Attrition analytics

Task 8 - Team productivity

Task 9 - Payroll reconciliation

Task 10 - Budget and KPI targets
