PulseIQ Analytics - Phase 2 Report

Poonam Satish Patole | Data Analysts track | Phase 2

GitHub repository	PoonamPatole/pulseiq
Git tag	**phase-2** proposed for this submission; only **phase-1** exists locally.

Task status and evidence

Task	Status	Evidence
6. Attendance and leave	Done locally	Dashboard screenshot Observations and screenshot notes
7. Attrition analytics	Done locally	Dashboard screenshot Findings
8. Team productivity	Done locally	Dashboard screenshot Two-team verification
9. Payroll cost and reconciliation	Done locally	Dashboard screenshot Reconciliation and exclusions
10. Budget and KPI targets	Done locally	Dashboard screenshot Manual variance checks

Proof it works

- **Task 6:** The three lowest observed all-department attendance rates were May 2026 92.64%, January 2026 93.11%, and June 2026 93.16%. These are observations, not causal explanations.
- **Task 7:** A query matching the dashboard aggregation returned Engineering (Mar 2025): 5 exits, 3.40%; Operations & IT (Mar 2024): 4 exits, 13.79%; Engineering (Apr 2025): 3 exits, 2.10%. Predicted risk is separated and small groups are suppressed.
- **Task 8:** Direct checks of `warehouse.fact_task`, sprint SP-01, matched velocity: Analytics & BI had 22 completed tasks / 79 points; Data Platform had 29 / 72.
- **Task 9:** Task 3 check DQ-C01 reports five payroll-to-ledger differences. June 2026 is -INR 18,450 (payroll minus ledger); four other months are recorded for investigation. No rows were excluded. The answer key is company-level and does not validate department allocation.
- **Task 10:** Three April 2025 hand calculations matched dashboard variance (actual minus budget): Engineering -INR 1,911,891.25 (-8.19%); Product & Design -INR 461,307.33 (-8.73%); Data & AI -INR 100,184.00 (-1.32%).

These are local data checks and documented manual reconciliations. No automated Streamlit app test report is recorded for Tasks 6-10.

What I learned

Attendance and leave measures can have different grains, so leave needs a company-wide caveat. Actual exits and modelled risk answer different questions and should stay separate. Team velocity makes more sense with completed-task checks and sprint context. Payroll and budget comparisons need clear sign conventions, traceable sources, and visible uncertainty.

Problems and how I handled them

The attendance feed does not support reliable long-weekend labels, so I treat calendar holidays as context rather than cause. Attrition predictions are grouped and suppress groups below five. Payroll contains duplicate employee/run groups, orphan employee IDs, and five reconciliation differences; I preserved rows and documented the mismatches instead of guessing what to remove. The answer key is company-level, so it cannot verify department allocation. I checked three budget rows by hand and stated that negative variance means underspend.

Plan for the next phase

Prepare a shareable deployment and check access from another device, then complete release materials and a demo. Keep payroll exceptions visible until Finance confirms corrections, and update the evidence after approved resolution. Commit the phase files, apply the phase-2 tag, and record the release reference.
